
gaend Documentation

Release 1.0.0.dev14

Stephen Cagle

February 09, 2017

Contents:

1	Full Code Example	3
2	Motivation	5
3	Documentation & API	7
4	Installation	9
5	Test	11

Gaend converts `google.appengine.ext.ndb.Model`'s into HTTP endpoints. It provides validation, routing, documentation, and CRUD server endpoints. Its acts as a DSL for Google App Engine, allowing you to quickly write CRUD servers by only declaring `ndb.Model`'s.

Full Code Example

app.yaml:

```
runtime: python27
api_version: 1
threadsafe: true

handlers:
- url: /.*
  script: gaend.main.APP
```

main.py:

```
from google.appengine.ext import ndb
from gaend.models import GaendFullMixin

class Alien(ndb.Model, GaendFullMixin):
    proboscis_count = ndb.IntegerProperty(default=1)
    kind = ndb.StringProperty(
        required=True, choices=["Grey", "Martian", "Hutt"])
    name = ndb.StringProperty(
        lambda s: len(s) >= 1 and len(s) <= 20)
    full_name = ndb.ComputedProperty(
        lambda self: self.name + " the " + self.kind)
```

BASH:

```
> gcloud deploy app.yaml
...
Deployed service [modeling-agency] to [https://aliens-are-real.appspot.com]
...
> curl -H "Content-Type: application/json" \
  -d '{"kind": "Martian", "name": "Bob"}' \
  https://aliens-are-real.appspot.com/alien

{"key": "fsdafsda",  

 "kind": "Martian",  

 "proboscis_count": 1,  

 "name": "Bob",  

 "full_name": "Bob the Martian"}
```

Motivation

Sometimes your data is actually pretty simple.

1. You want to Create, Read, Update, and Destroy entities using REST endpoints.
2. You want to do validation on every write.
3. You want up to date documentation of your endpoints.

Sometimes, the `ndb.Model` class (`Alien` in the example) contains enough information to do all of the above bullet points. Why spend time writing boilerplate code that can be inferred? Are we programmers or are we programmers? Infer all the things!

Documentation & API

Gaend Read the Docs contains all documentation for Gaend; including the public API, FAQ's, as well as Cookbook examples.

Installation

```
> pip install gaend
```

Test

```
> brew install entr  
> find ./gaend ./tests -name "*.py" -print | entr -drc python runner.py  
$GOOGLE_CLOUD_SDK
```
